

# Jelly Printing

This makes about 350ml which is enough for a square or round jelly plate. If you have a baking tin you want to use fill it with water to measure how many millilitres it holds then work out quantities accordingly. An A4 size tin will take 3 times this quantity.

## INGREDIENTS

- 200ml Glycerine (available from chemists but cheaper to buy on ebay)
- 120ml warm water
- 35 grams gelatine
- 50 grams sugar
- A non stick baking tin
- One large and one small mixing bowl

#### METHOD

- 1. In the small bowl mix half the water with the gelatine, stir until dissolved.
- 2. In the large bowl mix the rest of the water with the sugar, stir until dissolved
- 3. Add the glycerine to the sugar mix and stir.
- 4. Add the gelatine and stir.
- 5. Place bowl in microwave and heat for 2 mins. Repeat if there are still lumps but don't let it boil.
- 6. Allow to set in the bowl for a few hours then reheat to melt it again. I have found this gets rid of any pesky air bubbles! Stir it gently as you don't want to *add* bubbles......
- 7. Pour into your baking tin and leave for at least 4 hours preferably over night.
- 8. Pull the edges away from the tin, flip over and carefully tweak out of the tin onto a flat surface. Tipping it onto waxed paper or cling film will allow you to move it around.

### NOTES.

NEVER put newspaper or magazine paper on top/underneath as it will stick to the plate.

Anything left on top will leave a texture ie cling film.

After using your plate if it has become scratched give it a wash and re-melt it!
